[View Details](#) | [Edit](#) | [Delete](#)

the system's ability to self-organize and to learn by its own means without external direction. The term "self-organization" refers to the ability of the system to act as its own controller and to regulate its own behavior. Self-organized systems are characterized by their ability to maintain a balance between order and disorder, and to adapt to changing conditions. They are often described as being "alive" or "conscious" because they exhibit complex behaviors and interactions that are not easily predictable from their initial state.

It is also evident that the number of species per genus is not constant, as shown by the following table:

10 of 10
